

***Prepare for IPT & VoIP with a
>> Network Readiness Assessment***

IP Telephony Readiness Assessment

Ronco Communications & Electronics, Inc. has been deploying business critical voice networks for over **30 years**. Our commitment is to ensure the continued success of our customers' voice networks with Traditional Voice or Advanced Voice Technologies.

Today **IP Telephony and VoIP** are technologies that the industry has defined as The Future of Telephony. These Advanced Technologies require the deployment of voice services on an existing or new data network infrastructure. Deploying voice services on a network presents new service level requirements and new technical considerations for the ongoing operation of a network.

It is important to understand what the capabilities are of your existing or new data network infrastructure. A Network Assessment will provide a detailed analysis of an entire network or a small area of a network. A Network Assessment from Ronco Communications will test the current infrastructure, test the capacity of the network and evaluated the effectiveness of Quality of Service (QoS).

After performing the Network Assessment, a customer will receive a professional report depicting the results of each test, along with recommendations to enhance capabilities in an area of the network that did not perform to your expectations.

Look to Ronco Communications to provide you a Network Assessment that prepares your environment for the deployment of Advanced Voice Technologies. A Network Assessment can ensure project success and allow you to avoid unexpected network expenditures.

Test Current Infrastructure

Ronco will examine the effectiveness and performance of voice-enabled network equipment. Ronco will verify that prioritization techniques work as planned with a mixture of traffic and measure the performance impact of other network elements, such as Exchange, Citrix and SQL on delay-sensitive voice traffic.

Test Network Capacity

Ronco will test the limits of your network by generating a customer-defined number of voice sessions. Ronco will identify the point where call quality begins to suffer, empowering you to make informed decisions about the implementation and expansion of voice on the network.

Evaluate QoS Effectiveness

Ronco will evaluate the effectiveness of a network's Quality of Service (QoS) and prioritization design. You will have the knowledge to be assured that voice traffic is receiving necessary resources at the proper time without starving other business-critical applications.

***Redefining
the way
YOU communicate***
